Activity B

Introduction

In this document, i will lay out my digital solution to the client's (Toka Fitness) problem. They want me to design a product that can: provide users with information and advise on fitness training and healthy living, provide customers with access to digital content to help them with their training and healthy lifestyle, and encourage customers to use more of their products. This should be rather easy to design and create.

Languages:

HTML – Will be used to create the website

JavaScript – Will be used to add dynamic features to the webpage and allow users to create and account

PHP – Will be used to create the forum page

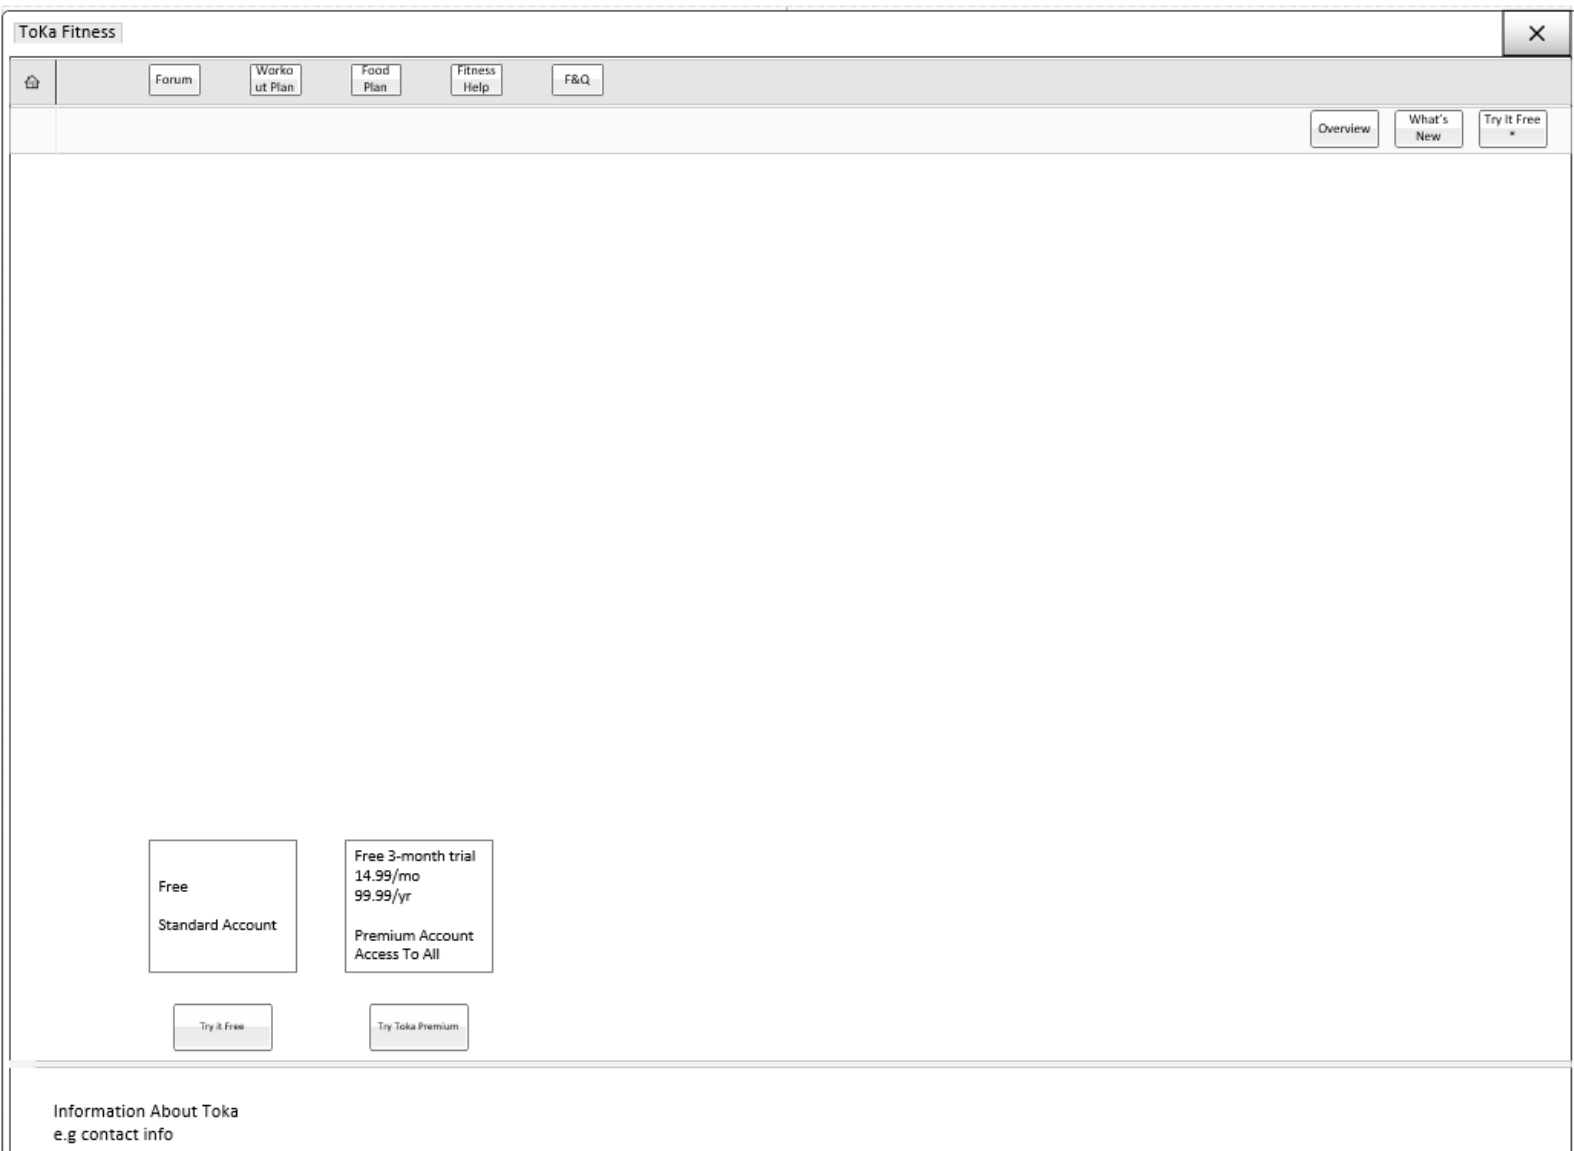

Visual/Interface Designs

I have made a quick wireframe outlining key aspects of the main page for the website, along top i will have two navigation bars, the darker one at the top will be a static bar, meaning that it will not be able to move. when you are scrolling down the page, however the lighter navigation bar will not be static and will come with you whilst scrolling, this will allow ease of access when navigating the page.

In the middle of the design will be a parallax background/text , meaning when you scroll the image will move or text will appear and fade.

Initially i thought of having a pop out side navigation bar using JavaScript, however I thought the overall design would be taken up by the side navigation bar and have decided to go for the standard type of navigation bar whilst still including some JavaScript within the top nav bar.

The F&Q Button on the top of the navigation bar will be a drop down menu, linking to the most asked questions, more details about the company, such as the company statement and much more.

For the user account create i came up with this quick design however it may change during development.

The Image below is for the a standard account, this account has basic access level to the website. The Premium user creation form is almost the same however it will ask for some bank details

Free
Standard Account

Data Requirements

The following data types will be used:

- Strings: used to store information such as login credentials, passwords, emails, and other text-related data.
- Floats: utilised to store decimal numbers, such as cash, because they are not whole numbers.
- Boolean: true or false to allow data to flow in and out at different times. Incorrect passwords, for example.

Test Strategy

Component to be tested	Test case	Test steps	Test results
Launch website	Verify the the website launches and can be accessed	1. open up the index html file.	1. User navigates to index file and opens it. 2. website loads Home page displayed
Create account	Verify that users can create and account	1. user selects standard or premium account 2. user enters their details into the text fields 3. account is created and stored into the database	1. user creates account 2. account details stored into database 3. user can now access the forum page if they selected premium
Login into account	Verify that users can login to a existing account with correct details	1. users navigates to login button 2. user enters username 3 user enters password 4. user clicks on submit button	User successfully logs into their account
Login into account	Verify that users can login to a existing account with incorrect username	1. users navigates to login button 2. user enters wrong username 3 user enters password 4. user clicks on submit button	Relevant error message displayed
Login into account	Verify that users can login to a existing account with correct username and incorrect password	1. users navigates to login button 2. user enters username 3 user enters wrong password 4. user clicks on submit button	Relevant error message displayed
Forum page	Verify that premium members can access and leave comments on the forum page	1. user logs into their premium account 2. users navigates to forum button 3. user clicks the forum button	Premium user can access forum page

		4. user is taken to forum page
